The background features several large, overlapping, curved arrows in shades of light green, light blue, and light purple. Scattered throughout are numerous small, yellow, triangular shapes, some pointing towards the center and others pointing outwards, creating a dynamic and celebratory feel.

Architecture for 3G and 802.16 Wireless Networks Integration with QoS Support

QShine '05

Speaker: Jen-Chu Liu

Introduction (1/2)

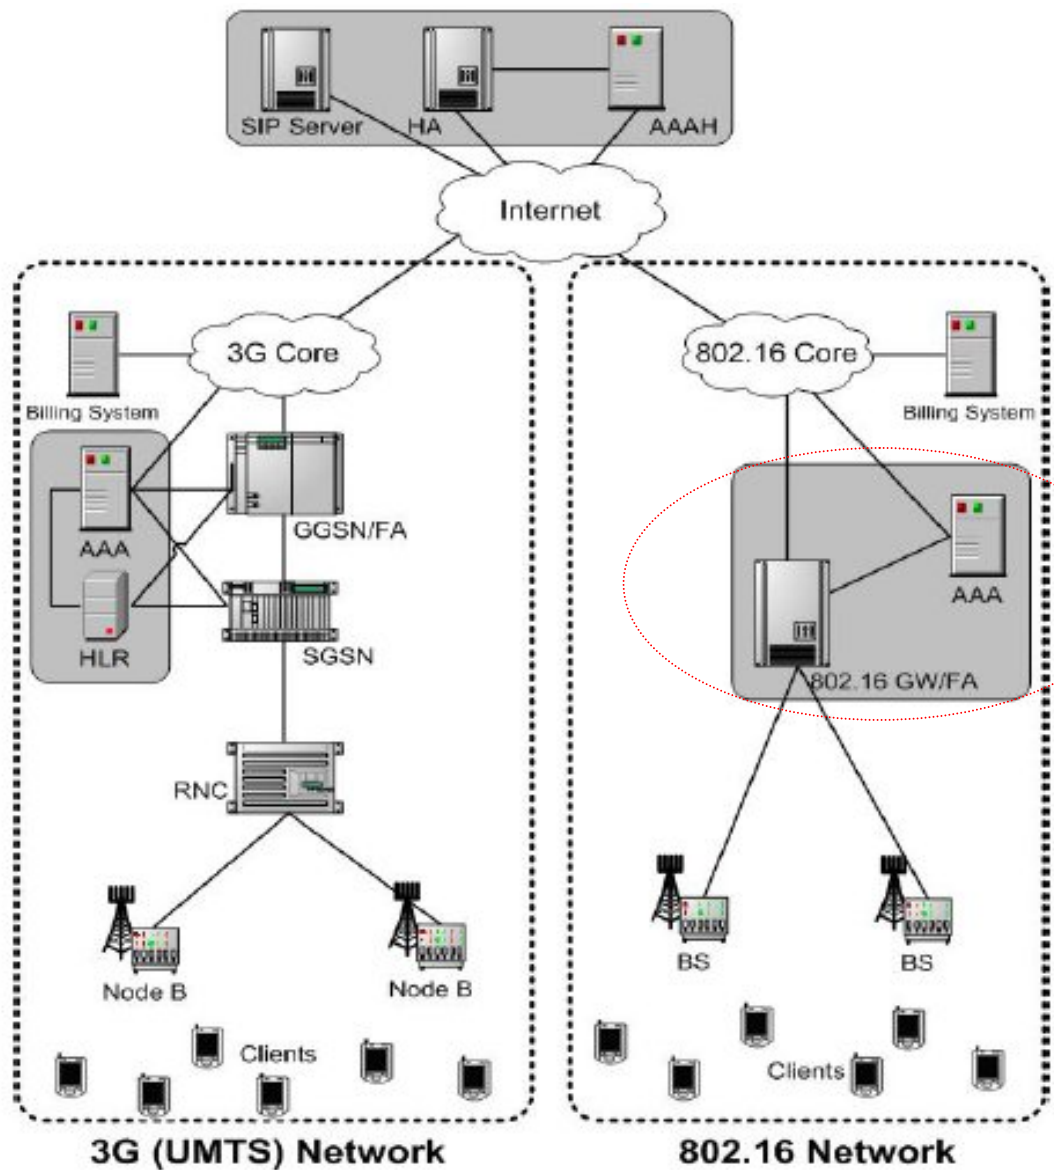

- 3G and 802.16 networks have different characteristics in terms of data rates, coverage, deployment and protocols, both networks provide explicit support for QoS.
- How to propose an architecture for integrating 3G and 802.16 networks, focusing on the QoS aspects, while providing seamless mobility?

Introduction (2/2)

- Loosely-coupled vs. Tightly coupled
 - Why the paper choose the loosely-coupled model?
 - Each of the networks being integrated do not need to be modified to meet the requirements of integrating with another specific network.
 - The data traffic for the 802.16 network is never injected into the 3G core, thus preserving the traffic patterns of the 3G network.
 - In the tightly-coupled scenario, the 3G core network must expose its interfaces to the 802.16 network.
- 
- 

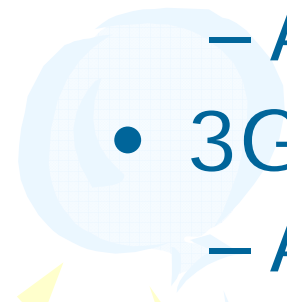

Integrated Network Architecture

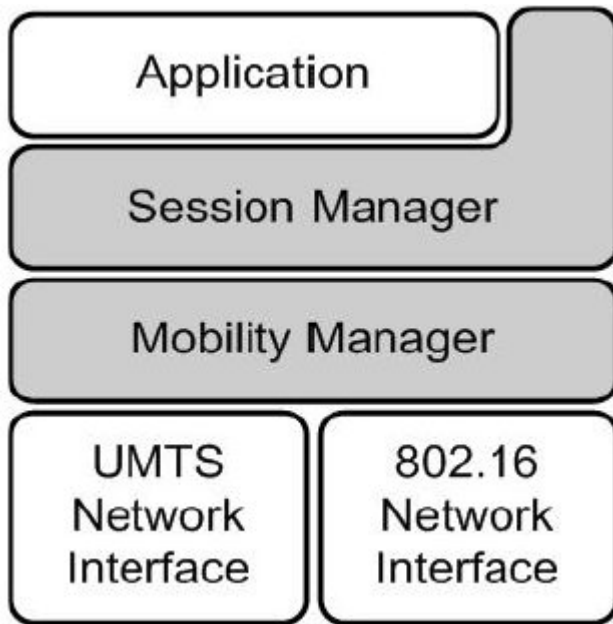

New component

New Components

- 802.16 Network
 - 802.16 Gateway
 - AAA server
 - 3G Network
 - AAA server
 - Common Entities
 - Home Agent (HA)
 - Home AAA server (AAAH)
 - SIP server
- 
- 

Mobile Node Software Architecture

- Mobility Manager
 - It is responsible for providing transparent switching between the networks.
- Session Manager
 - QoS
 - A feedback system of the network characteristics to the application.

QoS Provisioning in the Integrated Architecture

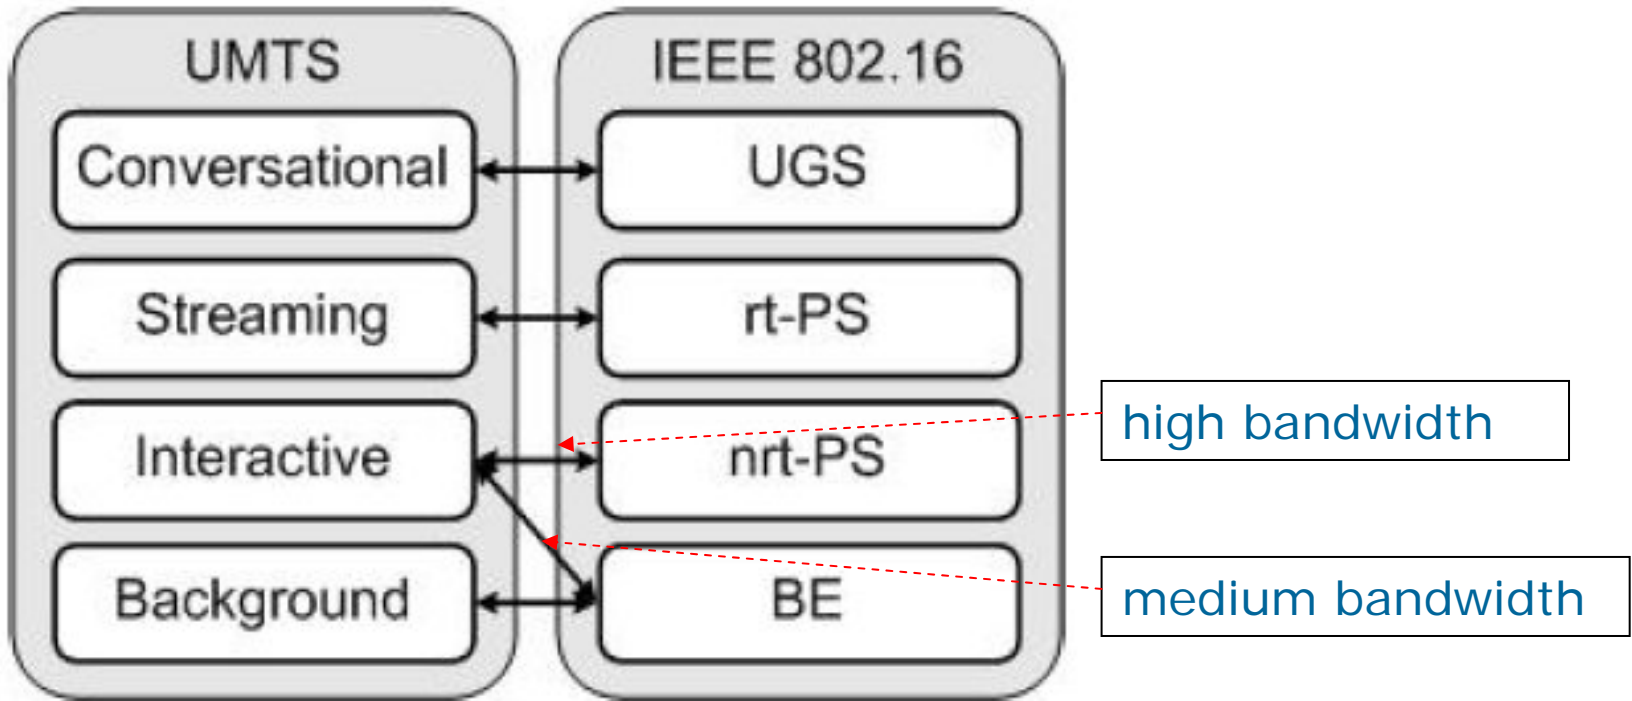

- QoS Session Activation
 - Mobile Node QoS
 - Handled by session manager
 - Network Infrastructure
 - QoS profile and authorization
- QoS Classification Mapping
- Network Layer QoS
- Session Layer QoS

QoS Provisioning in the Integrated Architecture

- QoS Session Activation
 - QoS Classification Mapping
 - Network Layer QoS
 - Session Layer QoS
- 
- 

Mapping between UMTS and 802.16 QoS Classes

Non-Real-Time QoS Class Mapping

Application Bandwidth Requirements	Example Application	UMTS	802.16
High	File transfer	Interactive	nrt-PS
Medium	Web browsing	Interactive	BE
Low	Email	Background	BE

QoS Provisioning in the Integrated Architecture

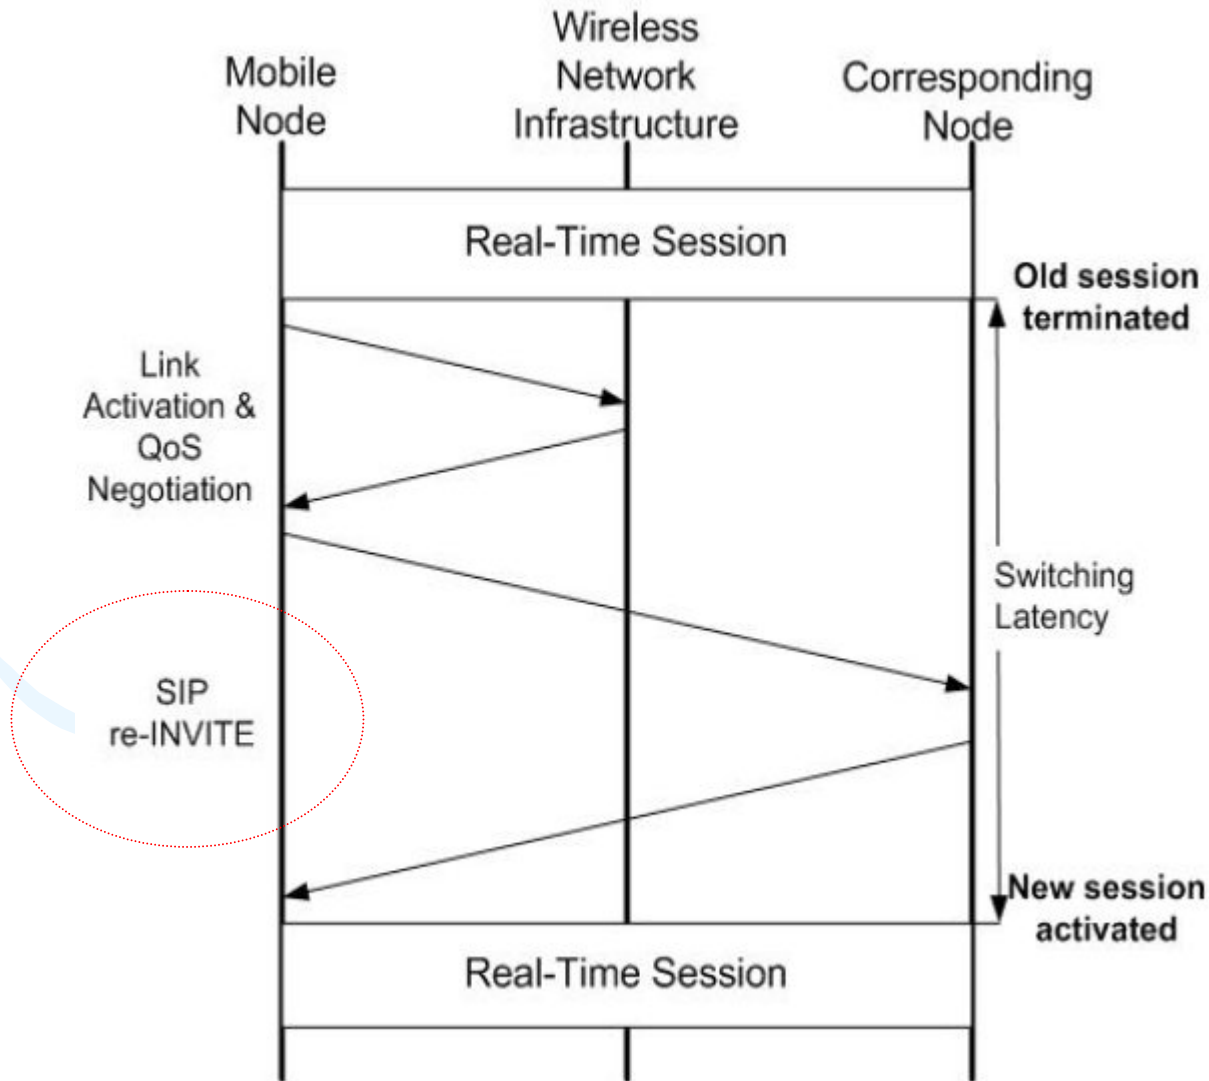

- QoS Session Activation
 - QoS Classification Mapping
 - Network Layer QoS
 - DiffServ
 - Session Layer QoS
- 
- 

QoS Provisioning in the Integrated Architecture

- QoS Session Activation
- QoS Classification Mapping
- Network Layer QoS
- Session Layer QoS
 - Non-Real-Time Session Mobility
 - Mobile IP
 - Real-Time Session Mobility
 - Supported by SIP

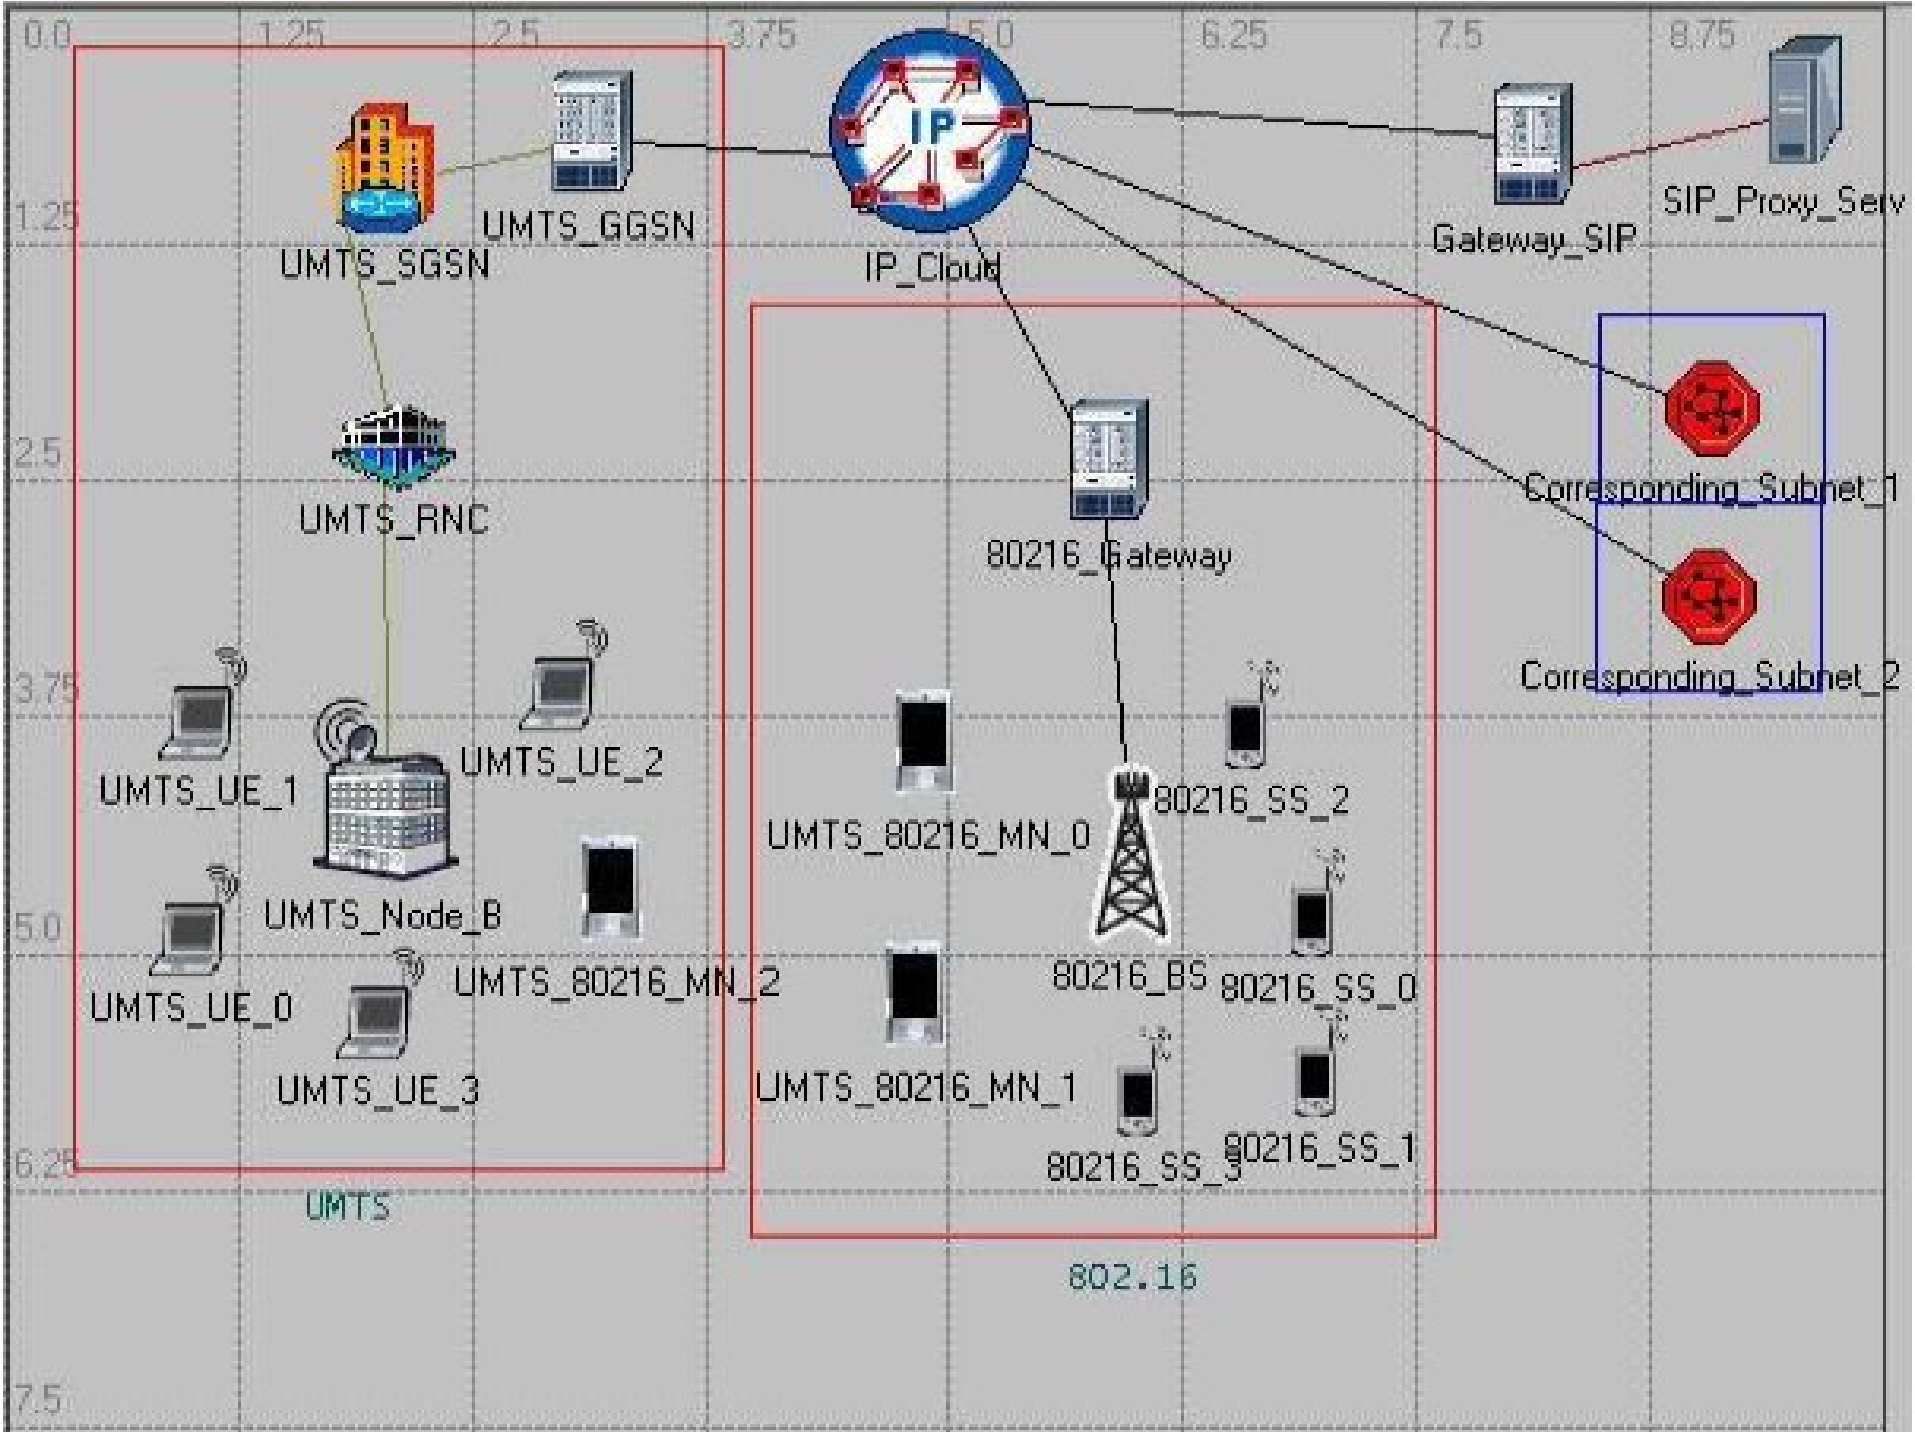

Mobility Procedure Using SIP

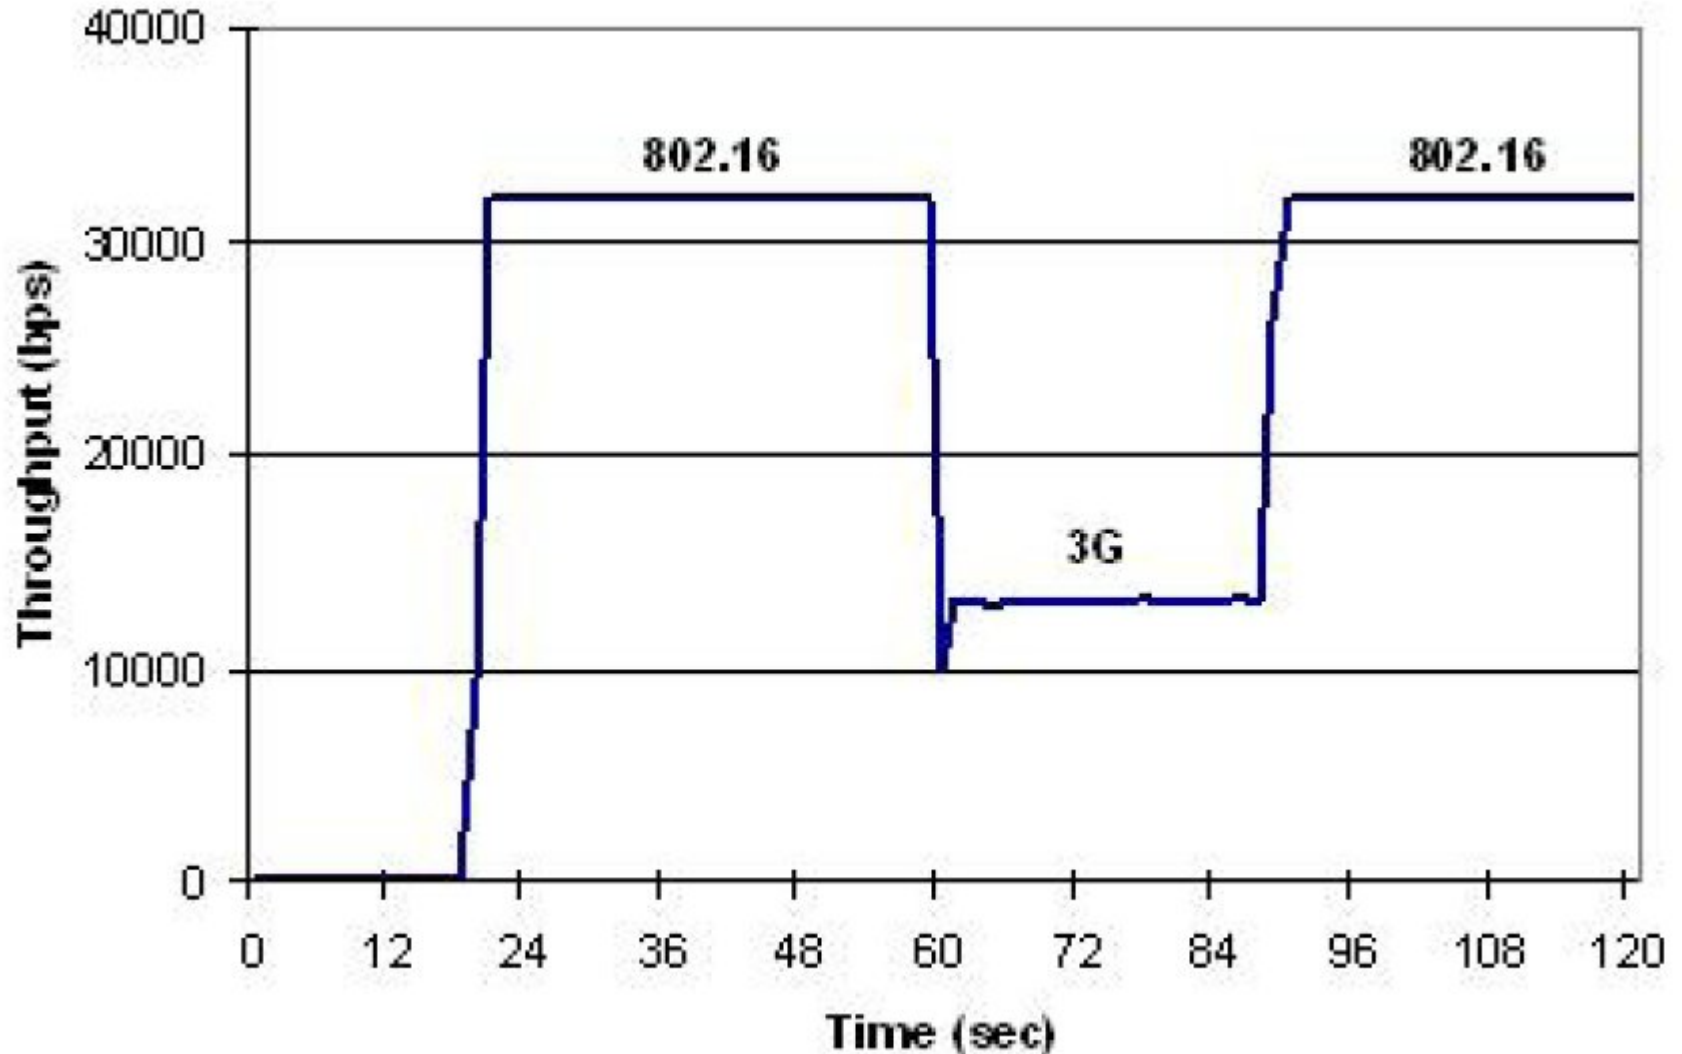

The Simulation Model

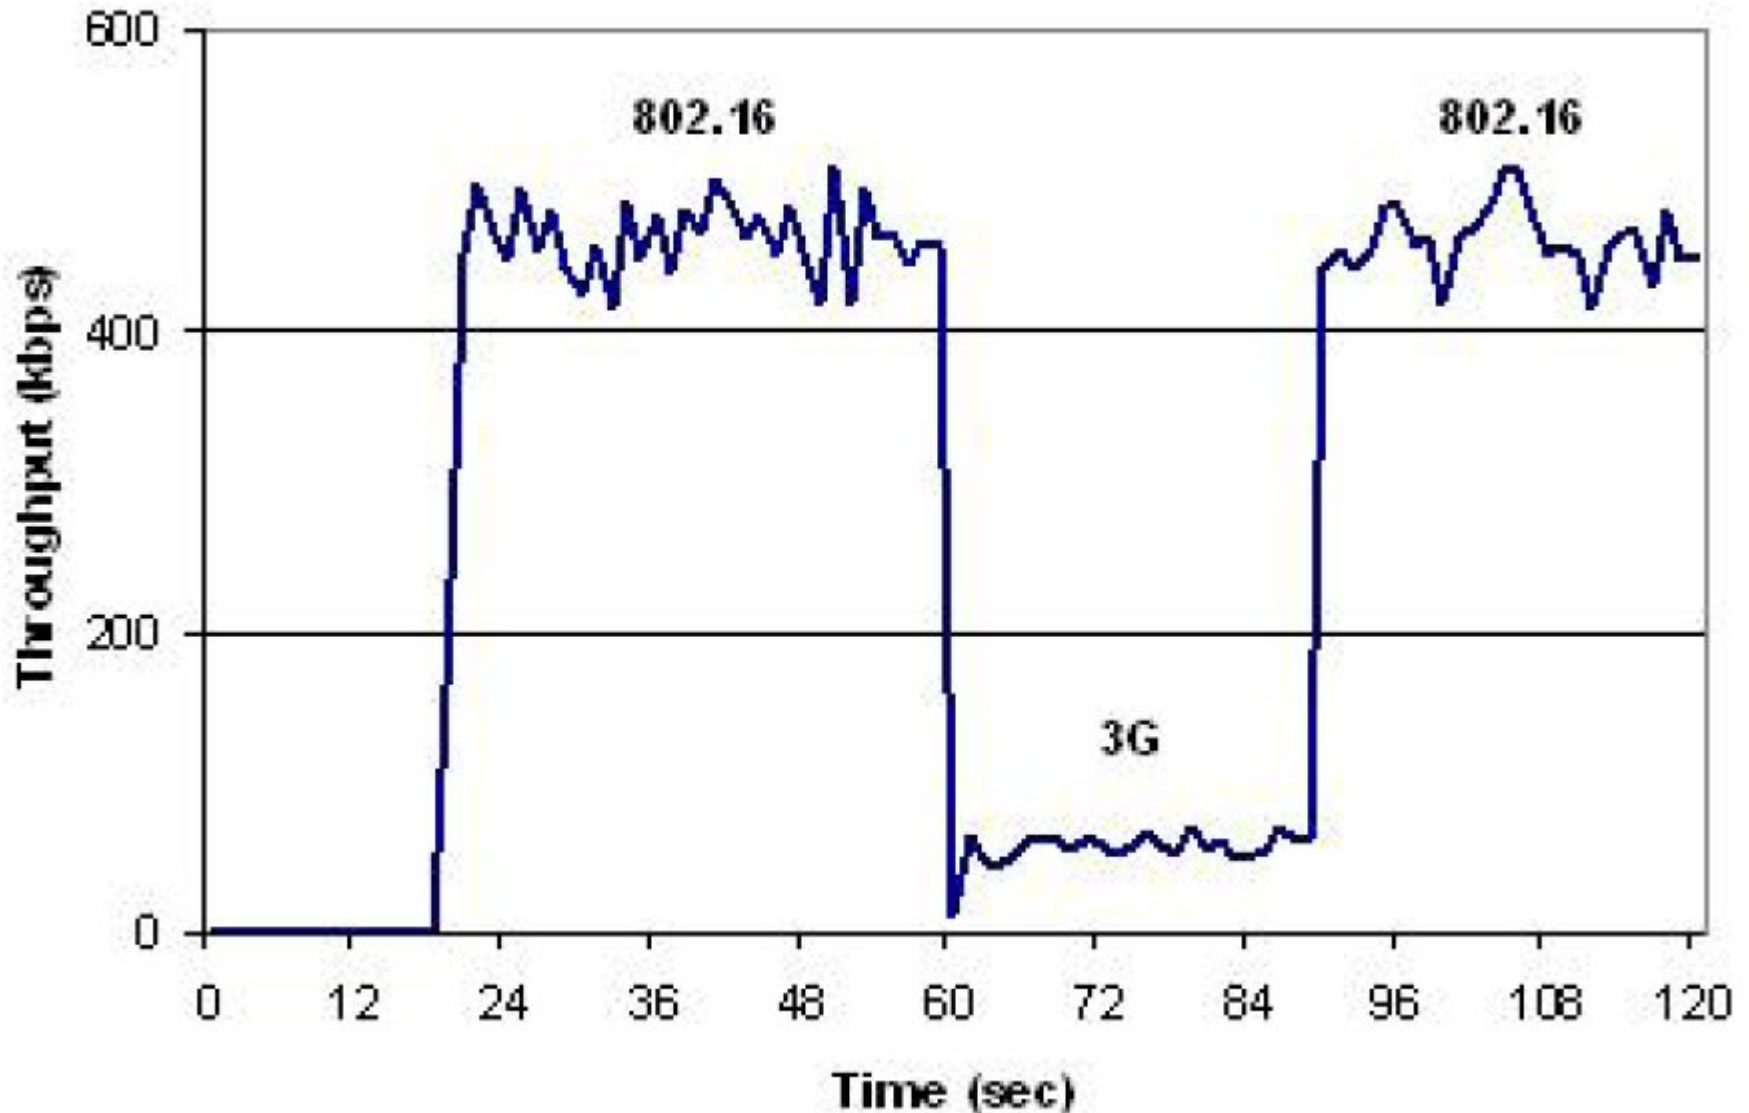

LEGEND	
Node Name	Description
UMTS_	UMTS nodes
80216_	802.16 nodes
UMTS_UE_	UMTS-only mobile nodes
80216_SS_	802.16-only nodes
UMTS_80216_MN_	Mobile nodes for integrated architecture
IP_Cloud	Internet
Corresponding Subnet	Subnet with corresponding nodes

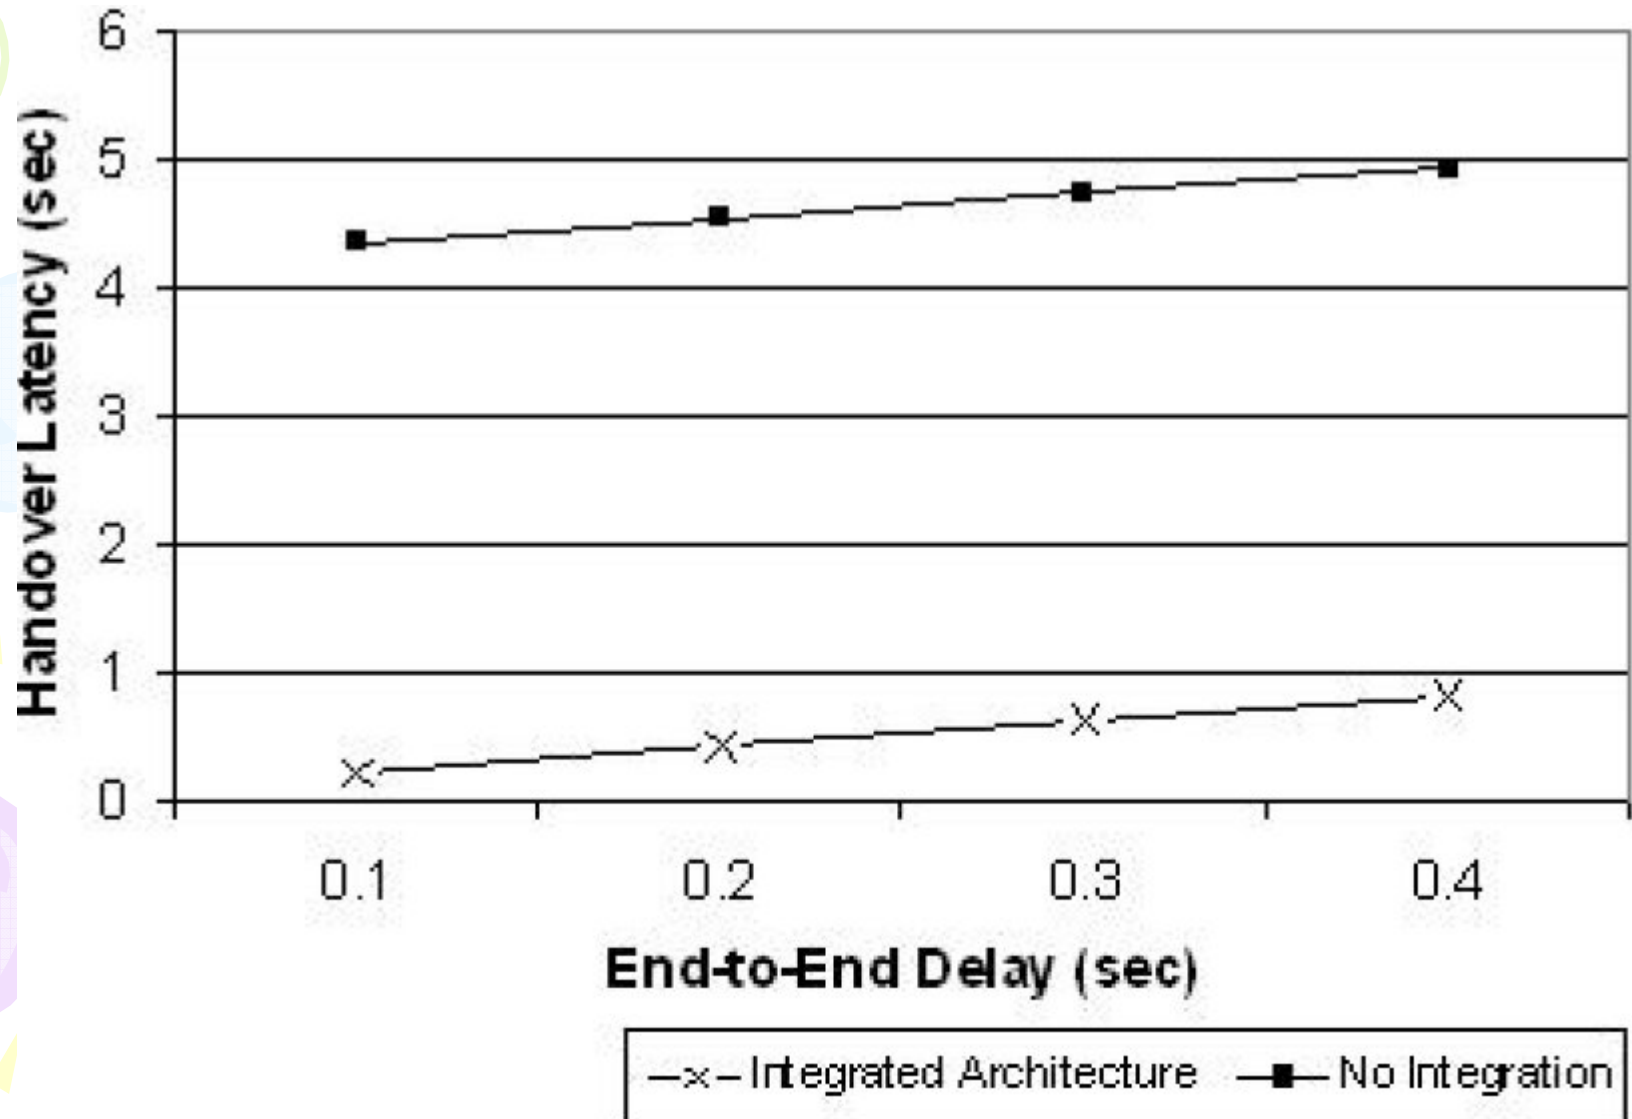

Throughput for CBR Voice Application

Throughput for VBR Video Application

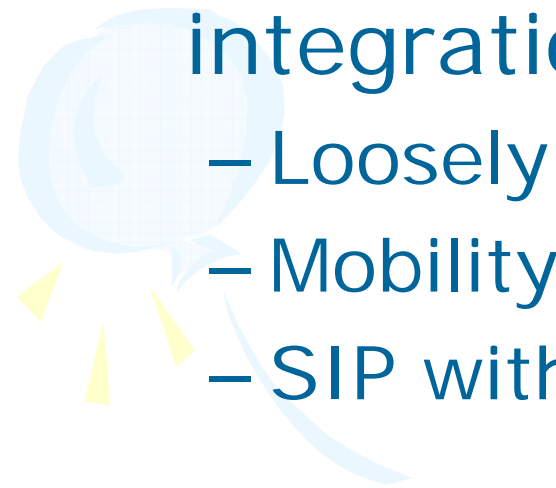

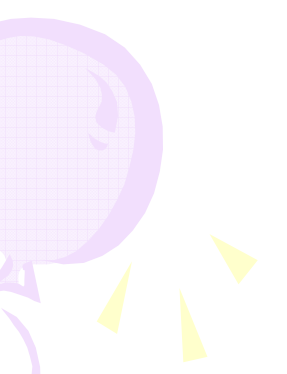

Switching Latency vs. End-to-End Delay

Summary

- This paper provides an architecture for 3G and 802.16 wireless networks integration with QoS support.
 - Loosely-coupled
 - Mobility manager and session manager
 - SIP with SDP
- 
- 

Discussions

- SIP extension for end-to-end QoS
 - Cross layer QoS parameters transmission
- QoS classes mapping
 - Different definitions in bandwidth and services
 - Network capability
- Mobility QoS?
